Hôpitaux de Marseille

 PÔLE FEMMES
PARENTS ENFANTS

WHAT DO WE KNOW?

- Survival of Extreme Preterms (EP) ↗
- Disability rates
 - higher than those born at term
 - inversely related to gestational age
- Only 5-10 % have severe disabilities
- **> 50% EP children have moderate or mild disabilities at school age**
 - Strong psychosocial and emotional impact on the EP child, the adult and their families
 - Urgent need for a quality of life (QoL) evaluation

Ancl PY. JAMA Pediatrics 2015
Serenius F. JAMA Pediatrics 2016

Breeman et al. Pediatrics 2015

PHENOTYPE NEUROCOMPORTEMENTAL ?

- WHO : Mild and/or moderate disability
- How
 - Individual profile (behavior, motor and cognitive)
 - No false methodology
- WHY
 - Social Impact

EPIPAGE 2

PRINCIPAUX OBJECTIFS

- **Pratiques médicales et organisations des soins**
 - Nouvelles pratiques en obstétrique / néonatalogie
 - Bénéfices et effets secondaires de traitements
 - Prise en charge de la prématurité extrême
- **Etiologie de la prématurité et de ses conséquences**
 - Complications de la grossesse
 - Histologie placentaire
- **Devenir à long terme des enfants**
 - Lésions cérébrales
 - Troubles cognitifs spécifiques
 - Problèmes de santé

ETAT D'AVANCEMENT

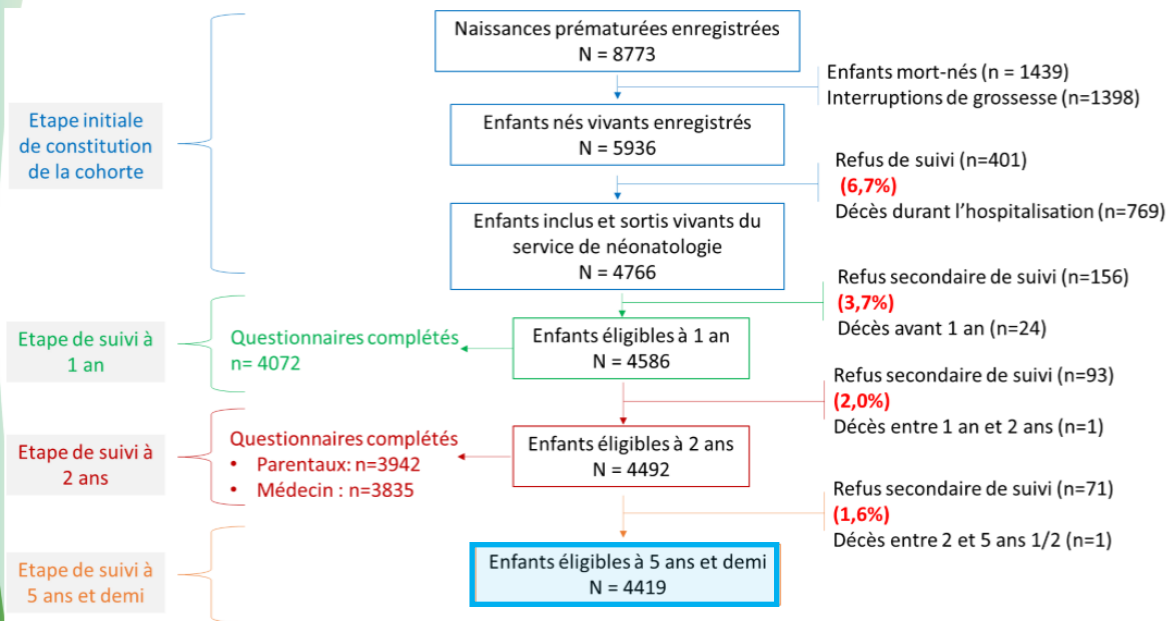

Table 1. Neuromotor, sensory and cognitive disabilities by gestational age groups. *V Pierrat BMJ 2020 EPIPAGE study*

	Total 24-31 w	24-26 w	27-31 w	Total 32-34 w	Trend p value	Term-born

MULTIPLE, SPECIFIC NEUROCOGNITIVE/BEHAVIORAL DISORDERS OFTEN ASSOCIATED TRUE NEUROBEHAVIORAL "PHENOTYPE" (NBP) OF PREMATURITY WITH CONSEQUENCES ON SOCIAL ADJUSTMENT

- Usually classification disability/no incapacity with FSIQ (Weshler)
 - absence of incapacity,
 - minor disability,
 - moderate disability,
 - severe disability
- FSIQ scores : complex processes involving multiple intellectual and non-intellectual characteristics (attention, emotions, motivation, movement planning, etc.)
- False methodology
 - threshold of ≥ 89 "normal", low average.
 - dispersion or dissociated subtest value = not reflective of the child's cognitive function
 - Child "normal" with dysexecutive syndrome and/or impaired behavior

SCHOOL-AGED EXTREMELY PRETERM (EPT) CHILDREN WITH MODERATE OR MINOR DISABILITY

- Low severity dysfunctions : ↗ school years into young adult.
- Social adjustment disorders correlated
 - with language
 - and/or executive disorders
 - and/or associated behavioral disorders.
- Topical issue +++: reflects that of the adult the child may become.
- Social adjustment : measured by the quality of life (QoL) evaluation

Korzeniewski SJ, *Dev Behav Pediatr JDBP* 2017; 38: 697-705

BUT...

- Quality of Life (QoL)
 - Measure of the individual's physical, mental and social well-being via his basic needs: biological, human warmth, work and leisure
 - Subjective measure that changes during the individual's lifetime
- Evaluation is contingent upon utilization of
 - Standardized and validated generic questionnaires
 - Designed to measure the QoL in the general population
 - Parental or self-evaluation

WHO 1994

QUALITY OF LIFE AND SCHOOL AGE ETP CHILDREN (WITHOUT SERIOUS SEQUELAE)

- QoL EPT children, has been reduced as compared to a reference children population.
- Independent determinants population's QoL :
 - language comprehension disorders,
 - Visuospatial disorders,
 - Executive disorders and
 - Behavioral disorders

Gire C : *Arch Dis Child* 2019; **104**: 333–339/*Pediatr Res* 2020; **88**: 642–652.

OBJECTIVE

- Identify neurobehavioral subgroups in an EPT population free from severe disabilities included in “GPQoL-study”:
 - 1) that shared similar profiles on the measurements of intelligence, executive functions
 - 2) by looking at the distribution of anxiety and behavioral disorders in each group
 - 3) correlating them with a QoL measurement.

TRIAL DESIGN (GPQOL STUDY)

- Cross-sectional multicenter, observational study
 - Between 2012 and 2015
 - 5 French Level III facilities
 - *Marseille Conception, Marseille Nord, Nantes, Nimes and Rouen*
- *Ethics*
 - Trial was approved by the national ethics committee
 - Trial registration number: NCT01675726

INCLUSION CRITERIA (GPQOL STUDY)

- EP child born before 28 week's GA
- Born between 01/01/2004 and 12/31/2007
- Hospitalized after birth in one of the 5 level III participating facilities
- School-aged child (7 to 10 years) at the time of inclusion
- Child capable of answering a French-language questionnaire
- Child whose parents or legal representatives have accepted the study's participation principles and have signed the informed consent

EXCLUSION CRITERIA (GPQOL STUDY)

- Death after discharge
- Child with severe cerebral palsy, or severe cognitive disability or autism
- Child with blindness or amblyopia, or deafness

ANALYSE DU COMPORTEMENT (SDQ)

QUESTIONNAIRE DES FORCES ET DES DIFFICULTÉS DE L'ENFANT

Les comportements observables dans la vie quotidienne de l'enfant.

- Problèmes émotionnels
 - «A de nombreuses peurs, est facilement effrayé»,
- Troubles de conduite
 - «Se bagarre souvent avec les autres enfants ou les tyrannise»
- L'hyperactivité
 - «Ne tient pas en place ou se tortille constamment»
- Problèmes avec les pairs
 - «Harcelé ou tyrannisé par les autres enfants», et les
- comportements prosociaux
 - «Gentil avec les enfants plus jeunes»).

COURSE OF THE STUDY

- A day-long evaluation between 8-10 y
 - Physical examination (Touwen infant neurological examination)
 - Psychometric evaluation (WISC IV, Rey's figure, Nepsy subtests)
 - Comportement (SDQ) et anxiété (STAI)
- QoL evaluation
 - VSP-A
 - French, 35 items, index total score and 9 sub-scores
 - Kidscreen-10
 - European, 10 items, index total score / 100

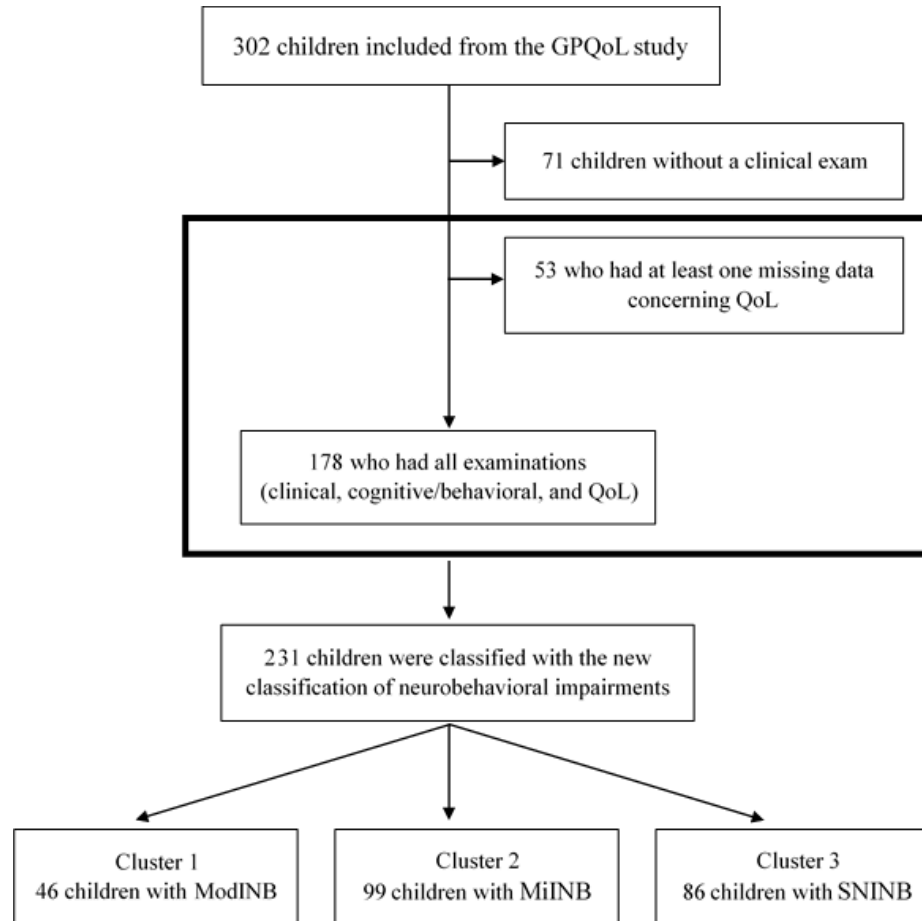

NEW CLASSIFICATION OF COGNITIVE/BEHAVIORAL IMPAIRMENTS

- CLARA algorithm (Clustering-Large-Applications)
 - constraint being the number of clusters (three in our study).
- The algorithm
 - the most similar subjects within each cluster,
 - and the most differences between the clusters.
 - Distribution by Psychometric evaluation (subtest WISC IV, Nepsy subtests, Rey figure)
 - The data of the anxiety and the behavior are distributed in each cluster.
 - All data were then compared according to the three established neurobehavioral profiles.

FLOW CHART

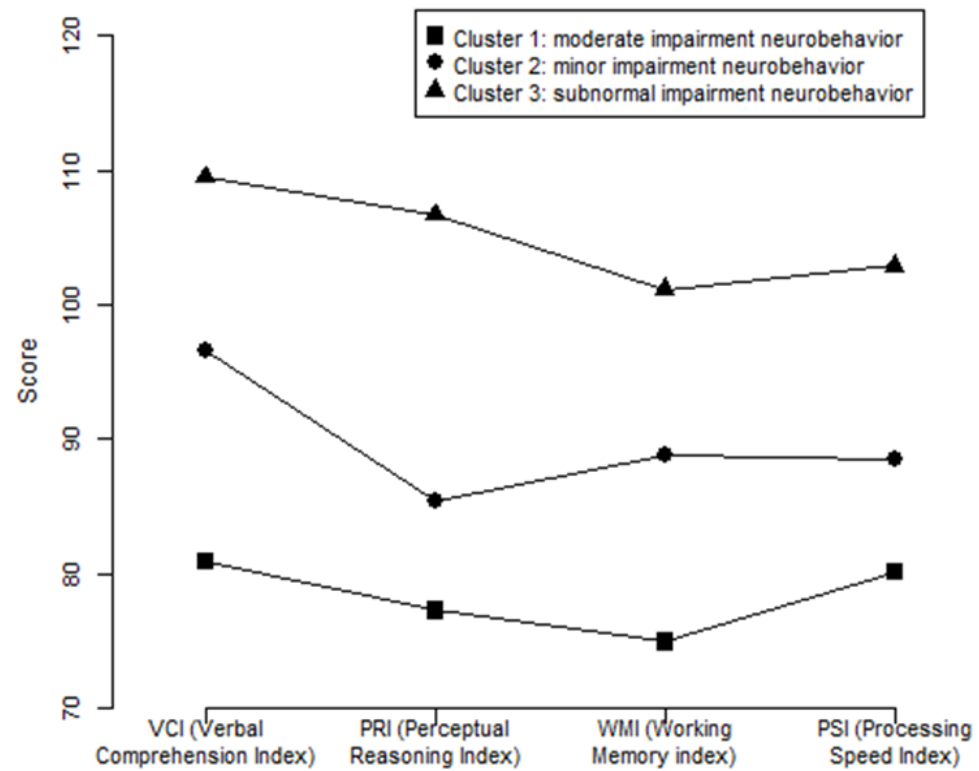

Result (1) : Cognitive/behavioral impairments profiles new classification (231 children three NBP)

- Cluster-1 (n=46 [20%]), Moderate Impairment NeuroBehavior (ModINB)
 - multiple impairments and behavior troubles ,
 - 95% of executive disorder
- Cluster-2 (n=99 [43%]), Minor Impairment NeuroBehavior (MiINB)
 - less severe multiple impairments and behavior troubles
 - 65% of executive disorder
- Cluster-3 (n=86 [37%]), SubNormal Impairment NeuroBehavior (SNINB),
 - 31% of executive disorder
 - emotional symptoms (score: 3.5 [SDs]=2.56: [slightly below average, therefore pathological])
- Dysexecutive syndrome, behavior and anxiety were :
 - significantly different between the different clusters
 - with a gradient of severity

SUBTEST FISQ AND CLUSTER

EXECUTIVE FUNCTION AND CLUSTER (NEPSY)

BEHAVIOR AND CLUSTER

CORRELATION OF NBP AND QUALITY OF LIFE

- The QoL was reduced to the reference population
 - by the parents. : Except relationship with the family and with the teacher,
 - the areas impacted
 - For the children, : 1 self-esteem, 2. relationship with friends, and 3. hobbies.
 - For the parents : 1. psychological well-being, 2. school-work, and 3. general well-being (Table 2).
- Between the clusters (NBP)
 - Significant QoL difference between the clusters in self- and hetero-evaluations.
 - The areas impacted : school-work and self-esteem
- Cluster-3 (SubNoNBP) : reduction in the QoL to the reference population.
 - For the children : 1. relationships with friends, 2. leisure, 3. General well-being.
 - For parental point of view, : 1. psychological well-being, 2. general well-being, and 3. vitality.

VSP-A ENFANT¹

VSP-PARENTS¹

KIDSCREEN-ENFANT²

DISCUSSION 1: PHENOTYPE NEUROCOMPORTEMENTAL ET FE

- *Heeren* study four neurocognitive profile :
 - diffuse impairment (cognitive and executive functions) for moderate and severe profiles,
 - Dysexecutive functions **only** in : “minor profile” .
 - FSIQ was insufficient for moderate or minor cognitive impairment of the EPT
 - impact minimized executive disorders : working memory and mental flexibility,.

Heeren T *Dev Neuropsychol* 2009; **34**: 393–421, O’Shea TM *Early Hum Dev* 2009; **85**: 719–725.

DISCUSSION 1: WMI, PSI, PRI AND MENTAL FLEXIBILITY WERE ALWAYS LOWERING IN OUR DIFFERENT NBP

- PSI, WMI, PRI, mental flexibility and emotional behavior worsening depending on the severity of the NBP.
 - PSI and WM : independent predictors of academic difficulties amongst the very premature-birth preschool children.
 - deficit in WM, and/or attention and/or PSI, impacts other mental processes,
 - cause of later deficit such as speech delay or dysexecutive disorders.
- PSI deficit (dependent on GA) correlated to executive functions:
 - WM (verbal and visuo-spatial),
 - inhibition,
 - cognitive flexibility.
- Correlation between measurement of PSI and/or WM
 - and impulsivity/hyperactivity
 - and attention disorders.

Mulder H ,Arch Dis Child Fetal Neonatal Ed 2010, Dev Neuropsychol 2009; 34: 393–421.

QUE SONT LES FONCTIONS EXÉCUTIVES (FE) ?

- Opérations cognitives qui permettent à l'individu d'adapter son comportement et ses activités aux exigences et fluctuations de l'environnement
- Elles entrent en jeu dès que l'individu est confronté à une situation non routinière ([résolution de problèmes](#))
 - **Planification** ou « Comment faire ? »
 - **Flexibilité** ou « L'art de s'adapter au changement »
 - **L'inhibition** ou « L'art d'ignorer des distractions ou de résister à donner une réponse plutôt qu'une autre »
 - **Mémoire de travail (MT)** ou « L'art de faire »

Problèmes

6e

b. Simon a économisé tout son argent de poches durant une année. Cela représente une somme de 260 euros. Combien a-t-il reçu chaque semaine ?

Exercice 5 : Moyenne de Philippine

Philippine voudrait savoir sa moyenne de maths de ce trimestre. Elle a eu 8 notes : 8, 12, 15, 6, 13, 11, 18 et 13. Quelle est alors sa moyenne de maths pour ce trimestre ?

Test de mesures
WPPSI, WISC
Subtest NePSY

DISCUSSION 3 : SUBNORMAL PHENOTYPE ONLY DYSEXECUTIVE AND EMOTIONAL BEHAVIORAL DISORDERS

- *Johnson* : concept of "behavioral phenotype of premature babies",
 - impact at school-age
 - attention deficit/hyperactivity disorders, social and emotional difficulties, and introversion

Pediatr Res 2011; **69**: 11R-8R , *Early Hum Dev* 2013; **89**: 199-207.

- *Gardner*²⁰ studied the behavioral and emotional state of VP adolescents
 - 1) from the parents' and teacher's point of view, increase in hyperactivity, relationship problems with peers and emotional disorders,
 - 2) from the point of view of the adolescent, emotional disturbances.

Pediatrics 2004; **114**: 676-682.

DISCUSSION 4 : NBP = DIFFUSE DISORDER COGNITIVE, MOTOR AND BEHAVIORAL, WHICH INFLUENCES SOCIAL ADAPTATION OR QOL

- QoL three NBP reduced as compared to the reference population.
- The QoL areas most impacted;
 - for the children's perspective self-esteem, relationship with friends and hobbies,
 - for parent's perspectives psychological well-being, school-work, and general well-being, consistent with our original study.

C Gire Arch Dis Child 2019; **104**: 333–339

- The more the NBP is altered, greater QoL is decreased.
- Decrease in QoL in a “subnormal” NBP :
 - inability of the VP child to manage his/her emotions
 - and with executive dysfunction.

C Gire Pediatr Res 2020; **88**: 642–652.

DISCUSSION (5)

- Review with instruments such as QoL, measurement of social adaptation and behavior,
 - EPTs had poor social adaptation skills early and persistent during childhood and adulthood
 - severity depending on GA, brain abnormalities and socio-economic status.

Ritchie K, *Dev Med Child Neurol* 2015; 57: 899-918.

- NBP of prematurity is due to **cerebral hypo-connectivity,**
- **leading to diffuse structural anomalies similar to autism spectrum disorders,** but with a reduced severity.

Conti E *Front Hum Neurosci* 2015; 9: 159.

LANGAGE ET PREMATURITE

EXEMPLE DE REPERAGE

- Développement du langage à deux ans est associé au neuro-développement
 - Faible stock lexical (expression)
 - Association
 - Motricité générale et fine
 - Résolution de problème
 - Performance sociale
- Rééducation possible par entraînement

CONCLUSIONS

- The prevalence of neurobehavioral disorders currently dominates the EPT's State at school-age.
- Socio-behavioral and emotional capacities associated with :
 - executive functions
 - and educational pathways.
- Knowing the long-term future of EPTs provides :
 - scientifically based, reliable information to parents and
 - improves care by promoting the prevention of these neuro behaviors disorders.
 - from pre-school-age, intervention strategies.
- Tools for “re-educating” executive functions could be integrated into school programs
- Diagnostic method (hypoconnectivity) : MRI, spectro.....
